FRIEND POSTER PACK

iPhone Reddit autoposter + autocreator - complete handoff

Read top to bottom, then give sections 9-11 to your coding agent

CONFIRM YOUR IPHONE FIRST

Written for iPhone 7 / iOS 15.8 / palera1n - other models need section 3 adapted

1. What this is

Two Windows GUIs drive one jailbroken iPhone over USB and post image posts to Reddit. Creator side mints isolated Reddit accounts (Ghost containers + iCloud Hide My Email). Poster side uploads your photos to assigned subreddits, one account per sub, with AI titles. Nothing here posts, creates, or sends anything by itself: every action is a button you (or your agent, supervised) click.

2. Zip inventory (exact tree)

- poster.bat / run_creator.bat - launchers. First run builds .venv (Python 3.11) and installs requirements.txt.
- misc/*.py - all bot code (79 files). You only operate poster.py + creator flows; the rest is imported machinery.
- docs/ - POSTER_RUNBOOK.pdf (post flow micro-detail), GHOST_EMAIL_TUTORIAL.txt + GHOST_EMAIL_CREATE_PROMPT.pdf, LIVE_AGENT_PROMPT.txt + LIVE_CREATE_PROMPT.txt (paste-to-agent prompts), CREATE_DAY1_TUTORIAL.txt, this guide.
- full-send/subreddits/<sub>/ and full-send/subscraper/pics/<sub>/titles/ - YOU create these (see section 7). Photo pools and title corpora are yours to fill; the pack ships no subs, no pictures, no corpora.
- logs/ - created on first run (slots, queues, maps, settings). secrets.TEMPLATE.json at root: copy to secrets.json and fill YOUR keys.
- NOT included by design: any photos, any logins, any API keys, any Chrome profiles, any queues or account lists.

3. Hardware + software you must have

- Windows PC with Python 3.11 (python.org), USB cable, iTunes drivers so the phone appears over USB.
- A jailbroken iPhone with Reddit installed (an App Store build that runs on YOUR iOS; if the installed Reddit needs a newer iOS than you have, stop and source a compatible build - never pirate an IPA).
- XXTouch Elite REQUIRED - on-device tap stack + live screen dumps over SSH plus its OpenAPI port. Open the app once, Remote Service ON, device auto-lock OFF, phone awake and unlocked (passcode lock kills automation).
- Crane (one isolated Reddit container per account), Ghost (device fingerprint: per-container identifiers), Shadow (jailbreak hide, Reddit-only). Reference setup was palera1n rootless iOS 15.8 - map each tweak to YOUR jailbreak/iOS; the flows below assume per-app container isolation exists.
- SSH over USB: the bats/USB probe expect the phone forwarded at 127.0.0.1:2222 (iProxy/usbmux). User mobile; type the SSH password into the GUI, never into chat.

4. Keys and secrets

- Copy secrets.TEMPLATE.json to secrets.json (repo root, gitignored - never share it).
- grok_api_key (xAI) REQUIRED: titles + flair picks. No key = Generate/Prepare log an error and queue nothing.
- iCloud user + app-specific password: only needed for the creator mail-code reads. SSH password lives in the GUI field.

5. Ghost containers (read GHOST_EMAIL_TUTORIAL.txt fully first)

- Ghost Home > Application List > Reddit > Containers > New Container. Names are zero-padded: a0001, a0002, ... a9999.
- Type the name, never paste (pasting drops zeroes). After Create, scroll to the BOTTOM (chronological, newest last), tap the name, then Formulate (identifiers). If the dump shows Advanced/Hide with no Formulate: tap Spoofer first.
- Set Advanced Hide + Pasteboard Prevent + Appium Prevent. Close Ghost after EACH container (Home + clear recents), reopen for the next. Never swipe Ghost Home (snaps to Reset/Erase). Never tap Generate & Apply, Albums, or the heart.
- One Reddit container per account, forever. Crane does NOT protect against device bans; Ghost spoofs the client fingerprint.

6. Hide My Email + Day 1 (read CREATE_DAY1_TUTORIAL.txt + LIVE_CREATE_PROMPT.txt)

- Settings UI only: mint one Hide My Email address labeled with the SAME container name (a0001 -> a0001).
- Creator GUI (run_creator.bat): Slots table. New Ghost container mints the next padded name. Create email for selected mints the matching Hide My Email. Create + Day 1 registers the Reddit account into that container + that email row.
- Never Sign In With Apple. Never Skip on verify. Never Join anything on Day 1. Creds land in logs/accounts.txt + slots.json.

7. Poster flow (read POSTER_RUNBOOK.pdf for the tap-by-tap)

- POOLS: create full-send/subreddits/<sub>/ and drop your JPG/PNG files in. Without pictures the bot logs 'pool empty' and skips - that is normal, not an error. Optional: full-send/subscraper/pics/<sub>/titles/*.txt with one sample title per line teaches Generate your voice (without it, generic mode). Posted files are MOVED to used/<slot>/<sub>/ (never reused by construction). Keep feeding pools; the bot never downloads pictures for you.
- ASSIGNMENTS: logs/poster_sub_map.json maps container -> [subs], strict and forever-exclusive. One sub lives on exactly one container; a held sub refuses other containers with 'held by X (exclusive, forever)'. 1 post per (account,sub) per day.
- Post tab: pick container, Community, attach image, Generate (Grok: sub vibe + 25 sample titles + your image), LOCK IN queues it.
- Batch tab: Test batch = full dry run to composer (Post never tapped, statuses untouched). Start batch = supervised auto-post down the queue with 60-180s home-screen lingers. FIRE login = selected row, full path (IP + open + login + post). FIRE no-login = selected row on the staged session (PREP the container first). Clear posted = manual prune; the table also auto-hides posted rows older than 24h (file keeps everything for pacing).
- FLAIR: first encounter on a required-flair sub Grok-picks once from the visible sheet and caches it in post_settings; after that it applies silently. Demand levels required/optional/unknown are recorded live, never guessed.
- TITLE RULES: some subs demand keywords (stored per-sub note, auto-detected from composer dumps). Titles start capital-first, ASCII only, first-person poster voice, describe ONLY what is visible in the photo, never claim first-post/new-here.
- Karma-gated subs refuse at validate with a plain message until your accounts grow up.

8. Laws (never break these)

- Dump-first: every tap comes from a LIVE screen dump under dumps/ (nodes only). Never reuse old coordinates, never OCR-guess, never tap blind. No dump = stop and say what is missing.
- Top-level posts and comments only where the flow says so; never tap Join; keyboards: screenshot-verify typed titles/URLs (Vietnamese keyboards silently drop characters - retype slow on mismatch).
- Budgets per step (acquire/gate/type/verify) - stuck means halt + safe-park + report, never retry-loop.
- Cooldowns: ~5 min after a send; longer after logout/flags. Manual FIRE only - the assistant never posts/sends.
- Destructive actions need backup-first + your explicit word. profiles, queues, maps: file first, ask first.

9. For your coding agent: file map

- misc/poster.py - the GUI (Post/Batch/Test/Log/Stats/Subreddits tabs) + batch orchestration + queue pacing + Subreddits table.
- misc/reddit_post.py - community image flow (entry, composer, flair apply, submit, archive_used mirror) + home_linger break.
- misc/title_gen.py - BETA_PROMPT + Grok call + ASCII/grounding post-rules. Edit rules here to change title voice globally.
- misc/flair_pick.py - first-encounter Grok pick (single_form OCR collapse) + sheet X-close + composer-back proof.
- misc/slots.py + logs/slots.json - account rows (ghost/email/username/day1). misc/farm_stats.py - pacing + stats.
- misc/config.py - paths/ports/URLs. misc/comment_*.py, misc/ghost_*.py, misc/crane_*.py - imported machinery + creator flows.
- State files (all under logs/): poster_queue.json (items+status), poster_sub_map.json (allowlist), post_settings.json (per-sub flair/niche/demand), nsfw_url_ledger.json (posted URLs never refire), slots.json, accounts.txt.

10. For your coding agent: workflow rules

- py_compile every edited .py, then run misc/commenter_regress.py - must print 305 pass 0 fail before reporting.
- Backup-first on every edited file (sibling .bak-TIMESTAMP). Short bullet replies. Never fire/send from code.
- Pure helpers stay pure (regress pins them with fixtures). Phone flows: dump-first, prove-every-tap, abort-loud.
- To add a sub: pool folder + titles (optional), allowlist entry, Prepare, Test batch dry, then FIRE login once supervised.

11. Troubleshooting first aid

- GUI shows two windows / phone acts possessed: close ALL poster windows (one instance only - second launch refuses with a popup).
- 'bot Chrome profile missing' (creator-side precache only): create subscraper/chrome_bot_profile, open Chrome on it once, log into Reddit, close it.
- HTTP 429 / grey Reddit screens: built-in backoff + browser restart + resume; if it persists, wait it out (throttle is server-side).
- 'held by X (exclusive, forever)': correct behavior - move the sub in the map only if you mean to reassign it.
- Pool empty for a sub: drop more JPG/PNG into its pool folder and Prepare again.
- Anything else: read the last 40 lines of logs/poster.log + the newest dumps/*.png before changing code.
