POSTER RUNBOOK

Community image post via Safari - micro detail from the verified live run

a0002 -> r/thong, 22 Sep 2026 - iPhone 7 iOS 15.8 - XXTouch Elite :46952 - 750x1334

COMMUNITY = SAFARI OPEN - NEVER THE APP SEARCH

app Select-a-community search is profile-dead-end - Safari OPEN only - dump-first, no guessing

Proven: a0002 (Sufficient_Act_7147) posted r/thong title 'Found the perfect thong at the mall yesterday' + 1 image. Chain: import -> close -> open container -> Safari URL -> Go -> OPEN banner -> NSFW Continue -> Create -> title -> image icon (keyboard down) -> picker photo -> Next -> Add -> Post -> settle -> archive posts/a0002/thong/ -> wipe -> close Reddit. CLI single: misc/reddit_post.py <container> <community> <title> <image.jpg> (same flow as the GUI Post button).

0. Preflight (every run)

- Phone awake unlocked, no passcode. USB serial a4e58990ded23b45ecf69f32a8aeddf5e1b654d4. Desktop iTunes + AMDS up.
- XXTouch Elite open, Remote Service ON, one Lua at a time. Screen 750x1334. SSH 127.0.0.1:2222 as mobile.
- Slot must be ready: ghost + email + reddit + day1 (slot_create_day1_done). Check logs/slots.json first.
- Title + image path come from the GUI Save-for-agent file logs/creator_state.json (title/images are memory-only in Tk).
- Dumps go to dumps/<stem>.json + .png. Identical PNG bytes = tap missed. Never reuse last run coordinates.

1. Prep the Camera Roll FIRST (before opening anything)

- Wipe the whole library: XXTouch clear.all_photos, log 'DCIM after wipe'. The roll must hold EXACTLY the post image(s) so the picker cannot pick wrong.
- Import ONE file: HTTP POST /image_to_album (bytes + MIME). Expect code 0 + 'Camera Roll import OK'. Community posts take ONE image only ('Posts can only include one attachment').
- Verified: 257,985-byte JPG imported as the single Camera Roll photo. If the picker later shows an empty grid, the files need minutes to index: Cancel back to composer + reopen the picker (fresh load). Never blind re-tap.

2. Close Reddit (guard first, skip when already closed)

- Hardcoded guard dump 939_preclose_check: REFUSE close on Verify/Username/Password/About/Interests/Building sheets (would have saved r10). Never close on Verify.
- Close = Home, double-Home 280ms, recents flick 375,780->375,60 until the Reddit card is gone (dumps 940/941/942/943/944). Not killall. Skip the whole dance when Reddit is not in recents (one cheap dump proves it).

3. Open the container (fast, no page hunt)

- press_home, dump 800_springboard, find the Reddit label. It lives on page 2 (one swipe 640,700->110,700); go straight there, do not re-dump page 1 twice.
- Tap the ICON, not the text: (label.x, max(80, label.y - 48)). Verified tap (114,1026). Never uiopen Reddit (skips the Crane picker).
- Dump 810_picker MUST show 'Select Container'. Tap the slot row center (a0002 hit at 375,379; names sit ~x=375). Dump 820_after_select must NOT be the picker (4 nodes = loading is fine, wait + redump). Log OPENED <slot>.

4. Safari to the community URL

- press_home (Reddit stays backgrounded in the slot). uiopen com.apple.mobilesafari. Dump 970_safari.
- Tap the URL bar (widest bottom node y>1140, verified 394,1195). press_backspace(40). type_text_block the FULL https://www.reddit.com/r/<sub>/ (verified 31 chars). Dump 972_typed shows the URL in the field.
- Tap Go (verified 681,1287; else RETURN key). Sleep, dump 973_page: must show 'Open in the Reddit app' + OPEN.

4b. Fresh Safari state EVERY run (stale tabs glitch the URL)

- Safari keeps old tabs. Typing a new URL into a stale reddit tab misfires: the iOS 'Open this page in Reddit?' sheet fires mid-flow and taps land on the OLD page (proven: typed couplesporn URL, tapped sheet-Open, landed on the thong page).
- Clear it FIRST: tap the far bottom-right tab-overview box (~690,1290) -> tap the X on the tab card (~597,148) -> Start Page (Favorites, Yahoo/Apple/Bing/Google, no reddit tab). Verified dumps 1401_tabs (1 Tab) -> 1402_after_x (Start Page).
- Then URL bar -> backspace 40 -> type the FULL URL -> dump 972_typed MUST show the exact string (a dropped 'w' once produced ww.reddit.com; clear + retype on mismatch).

- After Go: if the iOS 'Open this page in Reddit?' sheet (Cancel/Open) appears, tap Open ONLY with a verified typed URL. Then expect EITHER the Reddit-app community OR the Safari OPEN banner and verify which before tapping. Poll dumps until r/<sub> text or OPEN is on a LOADED page; never tap OPEN half-loaded.

4c. SAFARI_GUARD: dump-first before any URL-bar tap (locked 23 Sep)

- A blind URL-bar tap once landed in tab-groups view and typed nowhere (973_page stayed Start Page, ERROR OPEN not on Safari page). Empty-tab state always needs the walk-back, never a blind coordinate tap.
- safari_walk_back: dump 970_safari -> if 'tab groups' text and no address field, tap Done (from dump), re-dump 970_walkback -> if tab grid (Done low, still no address field), tap Done again, re-dump -> only tap the URL bar once 'search or enter website' is present (verified 127,1181). Max 3 rounds, then raise. Logged as SAFARI_GUARD lines.

5. OPEN banner, then the NSFW gate

- Tap OPEN top-right (verified 650,88). Sleep 2s.
- NSFW communities land on an 18+ gate ('NSFW means Not Safe For Work', Go Back / Continue). This recurs (first post AND later). Tap Continue (verified 543,887).
- Dump 975_community MUST show r/<sub> + member count + bottom bar (Create). refuse_join: NEVER tap Join. Verified r/thong 1,040,749 members.

6. Create -> composer check

- Tap bottom-bar Create (verified 379,1318). Dump 979_composer MUST show: destination r/<sub>, RULES, 18 NSFW tag, Title, body text.
- Read the composer notice: 'This community requires you to add an attachment.' means the image is MANDATORY (r/thong). Abort the post, do not post text-only.

7. Type the title (normal speed, verbatim, VERIFY)

- Tap the Title field (verified 82,337). type_human the EXACT saved title, ~95ms/key (verified 45 chars: 'Found the perfect thong at the mall yesterday'). Dump shows the wrapped title lines. iOS autocorrect underlines but changes nothing.
- KEYBOARD LANGUAGE WARNING: if the iOS keyboard is Vietnamese (space bar reads 'dau cach' / return reads 'Tiep'), key.send_text SILENTLY DROPS characters (proven: 'Love when he fills me up' typed as 'Love uhen he fills me up'). ALWAYS screenshot-verify the title before posting. To repair: Cancel back (or stay), tap Title, backspace-clear fully, retype slower (ms=150), screenshot-verify again. Never post a mistyped title.

8. Image icon with keyboard DOWN, picker, Add

- Drag down (375,650->375,1000) to dismiss the keyboard FIRST. OCR toolbar boxes are wrong with keyboard up; correct at the bottom. Verified icon tap (145,1286).
- Picker MUST show Cancel + Folder + Camera + Next. Tap the single photo right of Camera (verified 326,201 = cam.x+250, cam.y-80).
- Tap Next (verified 638,1273) -> edit screen (Text/Draw/Filters/Crop/Save) -> tap Add (verified 637,1270) -> back in composer.
- Verify the thumbnail (X button) AND the title in the composer screenshot before posting. No thumbnail = do not post.

9. Post (once, then settle - do NOT hunt the post)

- Tap top-right Post (verified 666,85). Wait ~4s. If the 'something went wrong / double-check your post' toast appears, tap Post once more.
- Give it time to submit. Confirm cheaply: composer gone (no Post button / Add-tags / Title placeholder) + back on r/<sub>. Do NOT scroll the subreddit hunting the post (BEST sort buries new posts).
- Verified: after Post we were back on r/thong, no toast, composer gone.

10. Archive (MOVE to used/), wipe, close

- MOVE the source to repo-root used/<slot>/<sub>/ (clash-safe _2, _3; verified used/a0002/thong/Photo 28-06-2026, 11 52 59.jpg). The source LEAVES exif-bot/out/, so out/ empties as pics are consumed. Shared helper misc/reddit_post.py archive_used (community AND profile both move; no posts/ copy).
- Wipe the Camera Roll (clear.all_photos, log OK). Close Reddit: Home + double-Home + recents flick until the card is gone (verified 1 flick). Log POST_OK <slot> <sub>.

10b. Close-out: Reddit shut, exactly ONE Start Page tab (locked 23 Sep)

- Close Reddit fully after every post: press_home + recents flick per close_reddit (never killall), verify SpringBoard icon grid (dumps 980/944). A backgrounded Reddit reopens into the wrong container.
- One-tab rule (anti-grid measure): empty multi-tab state causes the grid trap that broke safari_open, so ALWAYS leave exactly one

Start Page tab. close_safari_reddit_tab removes the Reddit tab ((690,1290) overview -> (597,148) X); the grid must show '1 Tab' before the X and Start Page (Favorites, no reddit.com) after. Never leave zero tabs and never leave strays.

11. Speed notes (the user asked for instant)

- Intermediate dumps shot=False (a screenshot PNG is ~1.2MB per dump; ~11 of them ran before Create in the slow version). shot=True only for final proofs.
- Skip close_reddit when Reddit is not in recents (one cheap dump proves it). Jump straight to the SpringBoard page holding the icon. Trim 0.7/0.6/0.9s sleeps.
- Single SSH/XXTouch connection per run (batch steps into one script, not one process per tap).
- Never trade verification for speed: every tap still comes from a live dump node. Identical PNG = miss, retune, never guess.

12. Never-again list

- NEVER post to a community via the app Create + Select-a-community search (profile dead-end; only finds communities, never profiles - and the documented path is Safari).
- NEVER uiopen Reddit (skips the Crane picker -> wrong container). NEVER tap Join. NEVER post without the thumbnail. NEVER reuse last run coordinates.
- NEVER close on Verify / signup sheets. NEVER killall. After any .py edit: python -m py_compile. UTF-8. secrets.json never in chat.

13. Shared session doctrine (26 Sep 2026 - commenter-built, poster code untouched)

- The drawer ground-truth login probe (one hamburger tap at (56,83): 'Log in to add your communities' = dead, Your-Communities markers = alive) and the per-container verification rule (verify once per container switch, send proof backstops) were proven on the commenter path and apply as doctrine here: never trust feed-visible as login proof on any path. The Crane auto-restore chain (registry logs/slot_backup_map.json, icon taps, Continue at (509,803), settle + reopen + re-verify, no-kill rules) lives in the commenter session code; poster runs reuse the same backup files and the same hamburger rule by hand until wired. Nothing in the poster code path above was changed for this section.
